**COPPER TRIPEPTIDE-1**

Dr. Charlene DeHaven, M.D.
Clinical Director, INNOVATIVE SKIN CARE®

**DEFINITION**
Copper tripeptide-1 is a small protein composed of the three amino acids (protein building blocks) glycine, histidine, and lysine combined in a specific geometric configuration with the physiologically beneficial mineral copper. It is sometimes abbreviated GHK-Cu, indicating the chemical symbols for the four molecules composing it. These three amino acids have a very high affinity (attraction) for copper and are often found in association with this mineral in biologic systems. Within the body, Copper tripeptide-1 may be found both complexed with or without copper, although the form including copper is more beneficial. Since 1973 when Copper tripeptide-1 was discovered to cause aged liver cells to behave like young liver cells, a large body of scientific evidence has accumulated regarding the safety and beneficial effects of this fascinating compound.

**LOCATION IN THE BODY**
Injured tissues of all types contain Copper tripeptide-1, which acts as a signaling agent for processes of repair and regeneration, assisting damaged tissue to return to normal non-injured function. Copper tripeptide-1 was first found in human plasma, the liquid portion of blood minus the blood cells, and found to have helpful effects for liver cells. Soon, it was also found in saliva, urine, and collagen and then discovered to have important effects in repairing and maintaining all tissue types. Copper tripeptide-1 is bio-identical in that it has the exact chemical structure of molecules found naturally in the human body. Since it is a small molecule, it is able to move easily within tissue and around cells. Much of its benefit relates to its ability to efficiently bind and transfer copper ions. Copper tripeptide-1 is a member of a large family of copper-containing enzymes helpful in tissue repair, inflammation, metabolism, and synthesis of vital molecular structures.

**ACTIONS**
Copper tripeptide-1 belongs to a group of emergency response molecules which are released during injury and come to the body’s aid when the processes below are activated.

**Wound Healing**
A huge body of scientific evidence supports the essential role of Copper tripeptide-1 in acceleration of wound healing. This compound is released during any tissue injury to signal repair processes to begin. Research has documented its benefit when used in various types of wounds, including surgical, post-laser, ischemic, burns, skin transplants, hair transplants, and diabetic ulcers. Diabetic wounds healed three times faster in the presence of Copper tripeptide-1. Time to re-epithelialization is shortened.

**Tissue Remodeling**
Furthermore, Copper tripeptide-1 is active not only for primary healing but also for tissue remodeling, which is the return of injured tissue to normal architecture and function. It increases keratinocyte proliferation and normal collagen synthesis, improves skin thickness, skin elasticity and firmness, improves wrinkles, photodamage and uneven pigmentation, improves skin clarity, and tightens protective barrier proteins. Through effects on decorin, new collagen made in injured tissue assumes the correct anatomical configuration and structure rather than a disorganized scar. Matrix support structures of the dermis, including Collagen I, Collagen III, and glycosaminoglycans, are increased in the presence of Copper tripeptide-1 as normal tissue configuration is restored after injury. Scar-forming processes are minimized and protein synthesis increases through direct effects on fibroblasts. Copper tripeptide-1 blocks the effects of toxins on liver cells. It improves surgical outcome of joint replacements by increasing bonding strength and new bone formation between hardware and native bone. It also encourages healing of all types of gastrointestinal ulcers, including...
those secondary to inflammatory bowel disease.

**Anti-Tumor Effect and DNA Repair**
Copper tripeptide-1 has a strong anti-tumor effect, partly mediated via decorin. It protects DNA from damaging effects of radiation, including radiation for cancer treatments and photoaging from sun exposure. Tumor cell lines died in the presence of Copper tripeptide-1 while healthy cell lines were encouraged. This compound is therefore not only biologically safe, but actually protective.

**Stem Cell Anti-Senescence**
By modulating integrins and p63, Copper tripeptide-1 promotes the survival of stem cells in the basal epidermis. This suggests it could have an important anti-aging role and, in fact, the anti-senescent effects of Copper tripeptide-1 have been demonstrated on a number of tissue types. Radiation severely damages DNA and induces aging but fibroblasts exposed to radiation were able to restore their function to that of intact cells in the presence of Copper tripeptide-1.

**Anti-Inflammatory and Antioxidant Effects**
Many of the body’s intrinsic antioxidant systems, including superoxide dismutase, are induced by Copper tripeptide-1. Vitamin C and other antioxidant levels are increased in healing wounds. Its strong anti-inflammatory effect has been demonstrated during wound healing, photodamage, and wrinkle improvement.

**Anti Microbial Effects**
Copper tripeptide-1 lessens the risk of infection developing in a wound or in remodeled tissue. This partly relates to inhibition of ferritin ion release, a pro-oxidant.

**Nerve Cell Maintenance**
Copper tripeptide-1 has been suggested to have a potential therapeutic role in age-related neurodegeneration and cognitive decline. It improves axon survival and maintenance of nerves.
